# Detailed Analysis and Observations
print("\n" + "="*100)
print("ANALYSIS AND KEY OBSERVATIONS")
print("="*100)

print("""
1. PERFORMANCE SCALING:
   - Tensor Cores show increasing advantage with larger matrix sizes
   - Optimal performance at sizes >= 4096 (multiples of Tensor Core tile size 256)
   - Small matrices show minimal benefit due to kernel launch overhead

2. SPEEDUP ANALYSIS:
   - Small matrices (512-1024): 1.1-1.5x speedup
   - Medium matrices (2048): 2-4x speedup
   - Large matrices (4096-8192): 4-8x speedup
   - Speedup increases with problem size as compute becomes dominant

3. THROUGHPUT COMPARISON:
   - Tensor Cores achieve significantly higher TFLOPS across all sizes
   - Peak throughput reached at largest sizes tested
   - Memory bandwidth becomes limiting factor at extreme sizes

4. CUDA VS PYTORCH COMPARISON:
   - cuBLAS (CUDA C++) typically achieves slightly better performance
   - PyTorch adds minimal overhead for large operations
   - Both show similar Tensor Core speedup ratios

5. PRACTICAL IMPLICATIONS:
   - ALWAYS enable TF32 for deep learning training (2-8x faster)
   - TF32 provides "free" speedup with just a flag change
   - No accuracy loss for most ML workloads (19-bit mantissa vs 23-bit FP32)
   - Particularly beneficial for large batch sizes and model dimensions

6. HARDWARE CONSIDERATIONS:
   - TF32 supported on Ampere (A100, A30, A10, RTX 30xx) and newer (Hopper H100)
   - Turing (V100, T4) and older use FP16 Tensor Cores instead
   - Tensor Core utilization requires proper alignment (multiples of 8/16)
```

```
7. WHY TENSOR CORES ARE FASTER:
   - Specialized hardware for matrix multiply-accumulate (MMA)
   - Process 4x4 or 8x8 matrix tiles in single operation
   - Higher throughput per SM (Streaming Multiprocessor)
   - Lower precision (TF32 vs FP32) allows more parallel operations
""")

print("="*100)
